Continuation of 11. does NOT place the application in condition for allowance because: Burton, as discloses in the Final Rejection mailed 07/18/2008, overlaps the instant claims. Although Applicant argues that suture material need not be present at the distal end of the passageway, this is not found persuasive. Burton specifically teaches that the ends of the passageway absorb the fluid through capillary action so that suture material is inherently present. The capillary action absorbs the fluid into the openings of suture material. Furthermore, although capillary action is possible without suture material at the ends of the passageway to draw the fluid in the passageway, it would not be possible to specifically absorb the fluid without suture material as a present. Application is also argues that the ratio of diameters of the inner braid to the outer braid is not obvious. However, the instant specification only recites this ratio as preferable and does not provide evidence to show it as obtained through experimentation and not obvious.
